 B&W Version Available

PRO Package Color – Analog Camera

Narrative

Our Seaviewer Complete System is completely self contained and portable - ready to use out of the box (truly plug and play). All systems are fully tested at multiple times throughout manufacturing and then go through a final process of testing and charging just prior to shipping to assure complete user satisfaction.

With the standard battery you have 3+ hours of continuous use but with a cost effective upgrade you are able to increase the battery to approx 6+ hours. The convenience of having the external power connection and adapters for both 12v and 115-220ac allows unlimited usage. The battery status can be checked anytime with the built in battery meter.

The Seaviewer DVR allows you to capture underwater video without interruption because the recorders media (SD Card) is at the surface not in the camera so there is no need to pull the camera out of the water to change the recording media. Viewing the video in REAL-TIME and being able to completely control the camera settings, lighting, and DVR at the surface is very unique to Seaviewer.

GPS - The OPTIONAL integrated GPS allows the user to capture LOT/LAN on the video recording. During playback you will be able to see your specific location along with time and date.

Media – The recording media is removable which allows the user to change the media quickly and easily throughout the project. Although the Surface Console allows playback of the recorded video at anytime the removable media allows the recordings to also be viewed and edited on a computer.

Camera Details / Options

The included Seaviewer Model 950 Sea Drop camera comes with 50 feet of cable and internal lights. The Seaviewer Camera is designed to be used as a “Drop” camera. A drop camera is attached to a cable and lowered overboard while connected to the Surface Console. This deployment allows for the user to see the video in real-time at the surface. We offer several different camera bodies with the same high quality internal camera module.

During your selection process you can change the camera body based on your requirements and add additional cable up to 1000'.

Options – May add additional Cost

Extended Cable to 1000'

Upgrade or change to camera body

Cable Orientation (side or back entry)

IR or Bright White LED Lights Internal

External GPS ability

Camera Cable Reel

Larger Internal Battery with Charger Upgrade

Different Recorder / DVR
